## Abstract

We develop an application (Kimi) for planning and organizing personal events. Kimi runs on the Maemo 4.1 platform at Nokia N8x0 tablets. Basically, a user organizes her/his events on day and month basis. There is possibility to link events with persons from the system contact list; we plan to implement automated discovery of such links from social networks. Surfing the Internet event space and collecting events locally are supported; the current prototype works with with Google Calendar.
